

Python Coding Assignment

1. Take two numbers as input from the user and print their sum, difference, product, and quotient — each on a separate line. Handle division by zero with an appropriate message.
2. Accept a temperature in Celsius from the user, convert it to Fahrenheit and Kelvin, and print all three values with labels.
3. Take a string as input and print: its uppercase version, its length, and the string reversed.
4. Take three numbers as input and print the largest among them. Do not use the built-in `max()` function.
5. Take a year as input and print whether it is a leap year or not.
6. Build a simple calculator — take two numbers and an operator (+, -, *, /) as input, perform the operation, and print the result. Print an error message for invalid operators or division by zero.
7. Take a number as input and print its multiplication table from 1 to 10. Format each line as: $7 \times 3 = 21$
8. Take a positive integer n as input and print all prime numbers from 2 to n .
9. Keep accepting numbers from the user until they enter 0. Then print the total count of numbers entered, their sum, and their average. Do not include 0 in the calculations.
10. Take n as input and print a triangle pattern of n rows made of asterisks, where row i has $(2i - 1)$ stars centered appropriately.
